- Switching Algorithms Mid-Execution

Maximum Common Subgraph

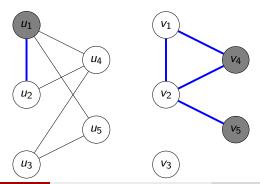

Definition

A maximum common (induced) subgraph between graphs G_1 and G_2 is a graph G_3 such that $G_3 = (V_3, E_3)$ is isomorphic to induced subgraphs of both G_1 and G_2 with $|V_3|$ maximised.

Maximum Common Subgraph

Definition

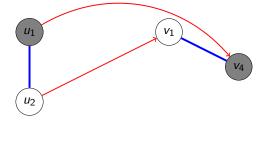

A maximum common (induced) subgraph between graphs G_1 and G_2 is a graph G_3 such that $G_3 = (V_3, E_3)$ is isomorphic to induced subgraphs of both G_1 and G_2 with $|V_3|$ maximised.

Maximum Common Subgraph

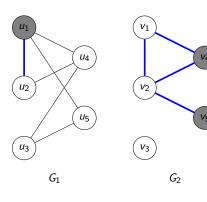

Definition

A maximum common (induced) subgraph between graphs G_1 and G_2 is a graph G_3 such that $G_3 = (V_3, E_3)$ is isomorphic to induced subgraphs of both G_1 and G_2 with $|V_3|$ maximised.

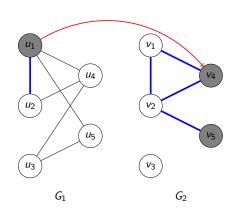

Algorithms

- McSplit, McSplit↓
 - McCreesh, Prosser and Trimble 2017
- clique encoding
 - McCreesh, Ndiaye et al. 2016
- k↓
 - Hoffmann, McCreesh and Reilly 2017

Partial solution: Upper bound: 4

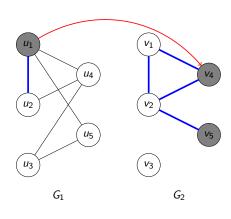

Label	G_1	G_2
0	u_2, u_3, u_4, u_5	v_1, v_2, v_3
1	u_1	v_4, v_5

Partial solution: Upper bound: 4

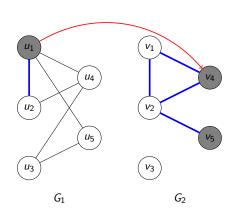

Label	G_1	G_2
0	u_2, u_3, u_4, u_5	v_1, v_2, v_3
1	u_1	v_4, v_5

Decision: $u_1 \mapsto v_4$

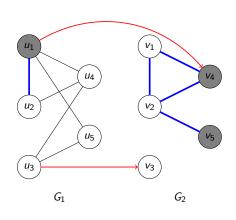

Partial solution: Upper bound: 4

Label	G_1	G_2
00	u_3	<i>V</i> 3
01	u_4, u_5	Ø
02	u_2	v_1, v_2
10	Ø	<i>V</i> 5

Partial solution: $u_1 \mapsto v_4$ Upper bound: 1+2

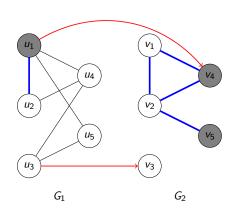

Label	G_1	G ₂
00	из	<i>V</i> 3
01	u_2	v_1, v_2

Partial solution: $u_1 \mapsto v_4$ Upper bound: 1+2

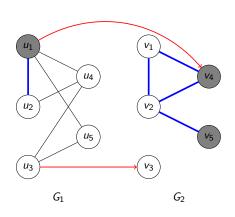

Label	G_1	G_2
00	и3	<i>V</i> 3
01	u_2	v_1, v_2

Decision: $u_3 \mapsto v_3$

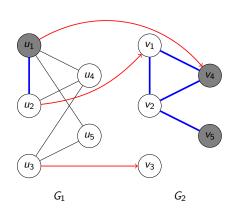

Partial solution: $u_1 \mapsto v_4$ Upper bound: 1+2

G_1	G_2
u ₂	v_1, v_2

Partial solution: $u_1 \mapsto v_4$, $u_3 \mapsto v_3$ Upper bound: 2 + 1

Label	G_1	G_2
010	<i>u</i> ₂	v_1, v_2

Partial solution: $u_1 \mapsto v_4$, $u_3 \mapsto v_3$ Upper bound: 2 + 1

Label	G_1	G ₂
010	<i>u</i> ₂	v_1, v_2

Decision: $u_2 \mapsto v_1$ Found a solution!

Backtrack to confirm optimality

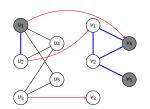

$k\downarrow$

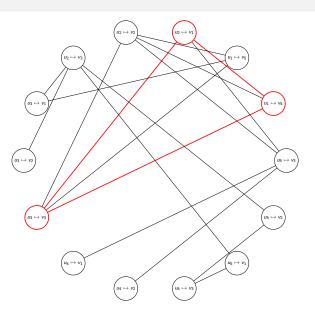

- k = 0: search for a complete subgraph isomorphism
- ullet k=1: allow one vertex of the smaller graph to not match anything
- ... and so on
- Developed to handle large instances
- Implements many domain filtering techniques

McSplit↓

- The main idea of $k\downarrow$ applied to McSplit
- Looks for a common subgraph of a set size (decreasing with every iteration)
- This allows us to prune more search tree branches

Clique Encoding

Definition (Bischl et al. 2016)

Given a set \mathcal{I} of problem instances, a space of algorithms \mathcal{A} , and a performance measure $m \colon \mathcal{I} \times \mathcal{A} \to \mathbb{R}$, the algorithm selection problem is to find a mapping $s \colon \mathcal{I} \to \mathcal{A}$ that optimises $\mathbb{E}[m(i, s(i))]$.

Definition (Bischl et al. 2016)

Given a set \mathcal{I} of problem instances, a space of algorithms \mathcal{A} , and a performance measure $m \colon \mathcal{I} \times \mathcal{A} \to \mathbb{R}$, the algorithm selection problem is to find a mapping $s \colon \mathcal{I} \to \mathcal{A}$ that optimises $\mathbb{E}[m(i,s(i))]$.

 (G_1, G_2)

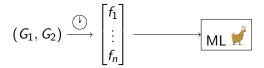

Definition (Bischl et al. 2016)

Given a set \mathcal{I} of problem instances, a space of algorithms \mathcal{A} , and a performance measure $m \colon \mathcal{I} \times \mathcal{A} \to \mathbb{R}$, the algorithm selection problem is to find a mapping $s \colon \mathcal{I} \to \mathcal{A}$ that optimises $\mathbb{E}[m(i, s(i))]$.

$$(G_1, G_2) \xrightarrow{\stackrel{\text{(b)}}{\longrightarrow}} \begin{bmatrix} f_1 \\ \vdots \\ f_n \end{bmatrix}$$

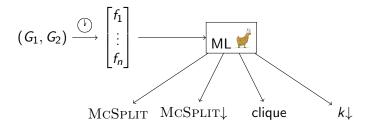

Definition (Bischl et al. 2016)

Given a set \mathcal{I} of problem instances, a space of algorithms \mathcal{A} , and a performance measure $m \colon \mathcal{I} \times \mathcal{A} \to \mathbb{R}$, the algorithm selection problem is to find a mapping $s \colon \mathcal{I} \to \mathcal{A}$ that optimises $\mathbb{E}[m(i,s(i))]$.

- 3 subproblems
 - no labels
 - vertex labels
 - vertex and edge labels

Number of Vertices Per Label

For each graph and label

- C is the number of vertices with that label
- E(C) is the number we would expect from a (discrete) uniform distribution

Features (34 in total)

- 1–8 are from Kotthoff, McCreesh and Solnon 2016
 - number of vertices
 - number of edges
 - mean/max degree
 - density
 - mean/max distance between pairs of vertices
 - o number of loops
 - \odot proportion of vertex pairs with distance \geq 2, 3, 4
 - connectedness

Features (34 in total)

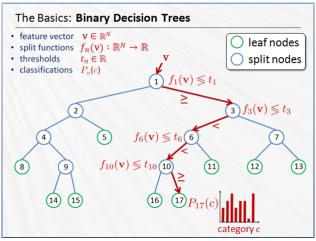

- 1–8 are from Kotthoff, McCreesh and Solnon 2016
 - number of vertices
 - number of edges
 - mean/max degree
 - density
 - mean/max distance between pairs of vertices
 - o number of loops

 - connectedness
 - standard deviation of degrees
 - labelling percentage

Features (34 in total)

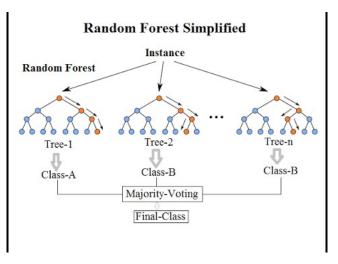

- 1–8 are from Kotthoff, McCreesh and Solnon 2016
 - number of vertices
 - number of edges
 - mean/max degree
 - density
 - mean/max distance between pairs of vertices
 - o number of loops
 - \odot proportion of vertex pairs with distance \geq 2, 3, 4
 - connectedness
 - standard deviation of degrees
 - labelling percentage
 - ratios of features 1–5

Errors

- Out-of-bag error
- For each algorithm
 - 1 − recall

Definition

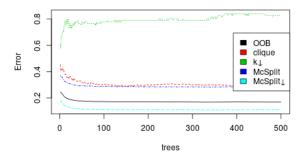

For an algorithm A, recall (sensitivity) is

the number of instances that were correctly predicted as A the number of instances where A is the correct prediction

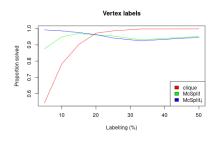

Errors (%)

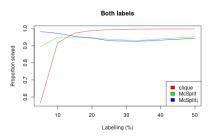

Error	Labelling			
	no	vertex	both	
out-of-bag	17	13	14	
clique	30	8	7	
McSplit	29	22	29	
$McSplit \downarrow$	11	11	11	
$k \downarrow$	80			

Convergence of Errors for Unlabelled Graphs

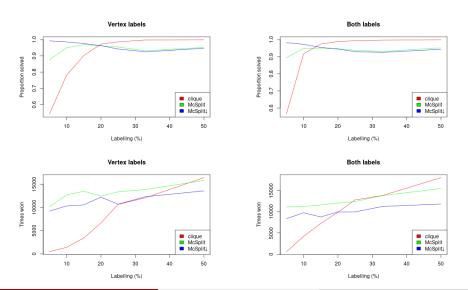

What Happens When Labelling Changes?

What Happens When Labelling Changes?

Idea 1: Switch After Making d Decisions

Idea 1: Switch After Making d Decisions

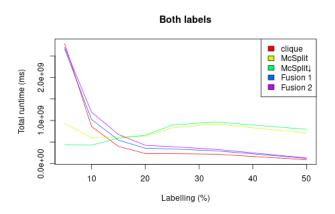

- Vertices of the association graph can be constructed from McSplit label classes, edges from the original input graphs
- Only a few extra lines of code:

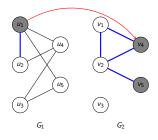

$$|incumbent_{clique}| \leftarrow |incumbent_{McSplit}| - |M|$$

and then

 $incumbent_{\mathrm{MCSPLIT}} \leftarrow incumbent_{\mathrm{MCSPLIT}} \cup incumbent_{\mathsf{clique}}$

Not That Good...

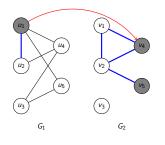

Label	G_1	G_2	
00 01	и ₃ и ₂	<i>v</i> ₃ <i>v</i> ₁ , <i>v</i> ₂	

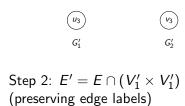

Label	G_1	G_2	
00	из	<i>V</i> 3	
01	u_2	v_1, v_2	

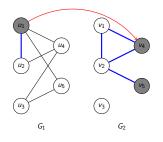

Step 1: Add vertices from label classes

	Label	G_1	G_2	
•	00 01	и ₃ и ₂	<i>V</i> ₃ <i>V</i> ₁ , <i>V</i> ₂	
	01	u ₂	v ₁ , v ₂	

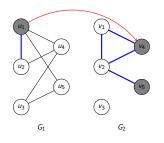

Label	G_1	G_2	New label
00	и3	<i>V</i> 3	0
01	u_2	v_1, v_2	1

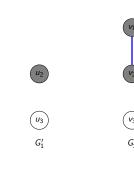

Step 3: label vertices according to vertex classes

Label	G_1	G_2	New label
00	и3	<i>V</i> 3	0
01	u_2	v_1, v_2	1

Step 4: Set

|incumbent'| = |incumbent| - |M|

Proof of Equivalence

Is it usable?

Nobody knows...
